

Customer Patch Governance Pack

Customer assurance | CVE-2026-48172 | Pack PF-20260527-934d6e60

Generated 27/05/2026, 11:13:46. Governed posture: Urgent scope confirmation required - final remediation decision blocked pending evidence.. Readiness: Blocked.

Executive Decision Summary

CVE-2026-48172: Urgent scope confirmation required - final remediation decision blocked pending evidence. PatchForge has public-source vulnerability intelligence, but customer asset and service exposure are not yet confirmed. 5 evidence gap(s) remain, and final approval has not been issued.

Recommended posture	Urgent scope confirmation required - final remediation decision blocked pending evidence.
Next best action	Confirm customer exposure and patch applicability before selecting emergency change, patch, mitigation, or risk acceptance.
Confidence	Low
Human approval	Still required

Customer Assurance Position

No customer remediation assurance can be issued yet because affected customer service scope and patch applicability evidence are not reviewed.

Customer Impact Status

PatchForge has public-source vulnerability intelligence, but customer asset and service exposure are not yet confirmed. Customer impact must be treated as unconfirmed.

Customer Evidence Required

- Reviewed Vulnerability Identity Evidence - Required evidence: Reviewed CISA/CVE/vendor advisory record confirming CVE, product, affected versions, and source provenance.. Owner: Security lead or vulnerability manager.
- Affected Asset Scope - Required evidence: CMDB, hosting control panel inventory, scanner output, asset owner confirmation.. Owner: Asset owner or infrastructure lead.
- Business Service Impact - Required evidence: Service map, customer-facing flag, SLA/OLA impact, service owner.. Owner: Service owner.
- Patch Availability And Feasibility - Required evidence: Vendor patch note, affected version mapping, test evidence, rollback plan.. Owner: Change owner or platform engineer.
- Human Source Review Event - Required evidence: Named reviewer decision accepting or rejecting source records.. Owner: Security lead or CAB reviewer.

Customer Communication Position

Customer communication should be limited to source-bound public-intelligence awareness and the active scope-confirmation work. Do not state that the customer estate is affected or remediated until reviewed exposure and patch applicability evidence exists.

What Can Be Shared With Customer

- PatchForge has recorded a source-bound vulnerability governance case.
- Known-exploited and EPSS-style signals are prioritisation inputs, not proof of tenant exposure.

What Cannot Yet Be Claimed

- Do not claim customer exposure, patch applicability, successful remediation, closure, certification, or risk acceptance unless reviewed evidence records those facts.
- Do not imply PatchForge deployed a patch or approved the decision autonomously.

What This Vulnerability Means

LiteSpeed cPanel Plugin contains privilege escalation vulnerability that is exposed via the user-end cPanel plugin, which can be abused by any cPanel user account to execute arbitrary scripts with root privileges. PatchForge treats this as a governance decision until source evidence, affected scope, and human approval are complete.

Why It Matters Now

It is flagged as known exploited in source-bound intelligence. FIRST EPSS source-bound signal is 0% with percentile 3%. The recorded remediation due date is 2026-05-29.

Affected Scope

PatchForge has public-source vulnerability intelligence, but customer asset and service exposure are not yet confirmed. This gap matters because severity alone does not tell the CAB what could break, who owns it, or whether customer-facing operations are affected.

Exploitability Intelligence

Exploit code, exploit payloads, and procedural exploitation steps are intentionally not provided.

Source-bound intelligence indicates this vulnerability is known to be exploited in the wild. EPSS gives a source-bound probability signal of 0% and percentile 3%. This informs prioritisation but does not prove exploitability in the tenant estate. CISA KEV indicates the vulnerability appears in a known exploited vulnerability source feed. EPSS provides a probability-style signal and may be lower. PatchForge treats these as prioritisation signals, not proof of tenant exposure. Customer exposure must be confirmed through asset and service evidence. Known exploited signal is present, but EPSS is low. This does not remove the need for scope confirmation. The safe governance question is whether exposure, service impact, patch feasibility, and compensating controls justify patch, mitigation, deferral, or risk acceptance.

CISA KEV indicates the vulnerability appears in a known exploited vulnerability source feed. EPSS provides a probability-style signal and may be lower. PatchForge treats these as prioritisation signals, not proof of tenant exposure. Customer exposure must be confirmed through asset and service evidence. Known exploited signal is present, but EPSS is low. This does not remove the need for scope confirmation.

Known exploited signal	Yes, source-bound pending review unless accepted
EPSS score	0%
EPSS percentile	3%
Ransomware campaign use	Unknown
Can close gates alone	No

Recommended Action Plan

Defer Pending Evidence is the current advisory posture. A known-exploited public-source signal reviewed customer asset and service exposure are not confirmed. This remains a governed posture. Prepare the evidence and report, but a human approver must issue the decision outcome.

- Confirm customer exposure and patch applicability before selecting emergency change, patch, mitigation, or risk acceptance.
- Confirm vendor patch availability or record mitigation-only posture.
- Attach affected asset scope evidence.
- Attach business service impact evidence.

Decision Snapshot

Vulnerability	CVE-2026-48172
Title	LiteSpeed cPanel Plugin Privilege Escalation Vulnerability
Severity	Critical
Posture	Defer Pending Evidence
Readiness	Blocked
Final approval	Not issued

Decision Options

- Recommended: Urgent Scope Confirmation Required - Status: Recommended Now. Reason: Known-exploited public intelligence exists, but customer asset and service exposure are not confirmed.. Required evidence: Reviewed asset scope, Reviewed service impact, Source identity review. Approval: Security lead or service owner confirms the affected scope..
- Emergency Change Required - Status: Blocked. Reason: Emergency Change Required is blocked pending asset/service exposure and patch applicability.. Required evidence: Reviewed affected scope, Patch applicability, Rollback plan, Customer/service impact, Human approval. Approval: CAB/security lead emergency approval..
- Patch Required - Status: Blocked. Reason: Patch Required is blocked pending patch availability, feasibility, and reviewed exposure scope.. Required evidence: Vendor patch note, Affected version mapping, Test evidence, Rollback plan, Service owner review. Approval: Change owner, service owner, and CAB/security approval..
- Mitigate Temporarily - Status: Blocked. Reason: Mitigate Temporarily is available only if compensating-control evidence is attached and reviewed.. Required evidence: Compensating control plan, Control owner, Monitoring evidence, Expiry or reassessment date. Approval: Security lead and service owner approve temporary mitigation..
- Risk Accept Temporarily - Status: Blocked. Reason: Risk Accept Temporarily is blocked until risk owner, rationale, expiry, compensating controls, and accountable approval exist.. Required evidence: Risk owner, Rationale, Expiry, Compensating controls, Residual risk statement. Approval: Named accountable risk owner approval..

Evidence Confidence and Gaps

- Reviewed Vulnerability Identity Evidence - Why it matters: CAB and customer assurance need confidence that the CVE, affected product, affected versions, and source provenance are correct before remediation decisions are presented as evidence-led. Required evidence: Reviewed CISA/CVE/vendor advisory record confirming CVE, product, affected versions, and source provenance. Owner/gate: Security lead or vulnerability manager; Source identity review.
- Affected Asset Scope - Why it matters: Without asset scope, the organisation cannot tell whether the public-source finding affects the customer estate or what operational risk a change would introduce. Required evidence: CMDDB, hosting control panel inventory, scanner output, asset owner confirmation. Owner/gate: Asset owner or infrastructure lead; Asset exposure confirmation.
- Business Service Impact - Why it matters: Severity alone does not tell the CAB which service, customer journey, SLA, or owner is affected. Required evidence: Service map, customer-facing flag, SLA/OLA impact, service owner. Owner/gate: Service owner; Business impact review.
- Patch Availability And Feasibility - Why it matters: The decision cannot responsibly select patch, mitigation, deferral, or customer assurance until affected versions, testing, rollback, and applicability are understood. Required evidence: Vendor patch note, affected version mapping, test evidence, rollback plan. Owner/gate: Change owner or platform engineer; Patch feasibility review.
- Human Source Review Event - Why it matters: Source-bound intelligence cannot become accepted positive evidence without a reviewer accepting or rejecting the source record. Required evidence: Named reviewer decision accepting or rejecting source records. Owner/gate: Security lead or CAB reviewer; Human evidence review.

Evidence, Trust, and Signing

Signed pack	PF-20260527-934d6e60
Verification	Verified
Signing provider	Azure Key Vault
Manifest hash	759d8910d3b99039916ed016812f8528aa037a9ed3b6553bade1774e90ceabc8
Source pack	Immutable and preserved

Bayesian Advisory

Availability	Generated
Advisory boundary	Advisory only; cannot close gates or approve risk
Recommended posture	Defer Pending Evidence
Exploit probability posterior	50%
Business impact posterior	35%
Patch feasibility posterior	27%
Change risk posterior	52%
Deferral risk posterior	54%

Vendor and Threat Landscape

Vendor intelligence	Reviewed vendor advisory evidence has not yet been attached.
Vendor applicability	Patch maturity, affected versions, workaround guidance, and remediation applicability remain unverified.
Threat landscape	Threat metrics shown below are source-bound public-intelligence signals and do not close hard gates.
Active exploitation signals	10
Critical open advisories	2

Patch maturity

Unknown

Source review

Pending review unless explicitly accepted

Blockers and Next Actions

- Reviewed Vulnerability Identity Evidence: Reviewed CISA/CVE/vendor advisory record confirming CVE, product, affected versions, and source provenance.
- Affected Asset Scope: CMDB, hosting control panel inventory, scanner output, asset owner confirmation.
- Business Service Impact: Service map, customer-facing flag, SLA/OLA impact, service owner.
- Patch Availability And Feasibility: Vendor patch note, affected version mapping, test evidence, rollback plan.
- Human Source Review Event: Named reviewer decision accepting or rejecting source records.

Automated Governance Analysis Completed

Human approval remains required. PatchForge does not approve CAB decisions, risk acceptance, patch deployment, or closure autonomously.

- Normalised finding identity
- Bound source provenance
- Applied governance boundary
- Correlated vendor/KEV advisory context
- Attached exploit-probability signal
- Generated Bayesian advisory snapshot
- Recorded live source-feed refresh history

Decision Boundary

PatchForge is a governance product. It does not scan environments, generate exploit code, provide procedural exploit steps, deploy patches, mutate production systems, approve CAB decisions, or accept risk autonomously.
